"Investigation of an Electrical Discharge in the Air Between Electrodes  
Covered With Dielectrics"

Leningrad, Zhurnal Tekhnicheskoy Fiziki, Vol XLI, No 6, Jun 71, pp 1287-1291

**Abstract:** There is very little experimental data on the basic nature and parameters of the occurrence of an electrical discharge in the air between electrodes covered with dielectrics. The present article describes a method of investigating a discharge of this type. With the aid of an electric-optical converter and an oscillograph, optical and electrical images of the discharge were recorded simultaneously at various moments of sinusoidal voltage applied to the electrodes. It was established that the electrical discharge is discrete and is generated in the form of a series of spark channels. The geometric dimensions and number of the spark channels in a particular series depend on the type of dielectric used and on the width of the air space between the electrodes. It was also established that the voltage of the extinguishing of the discharge was not constant; it depends on the number of spark channels in each series of the discharge. Finally, the magnitude and polarity of the voltage had almost no effect on the optical image of the development of the discharge.

"Changes in the Conditioned Activity of Rats Under the Influence of Accelerations"

Moscow, Zhurnal Vysshey Nervnoy Deyatel'nosti imeni I. P. Pavlov, Vol 23, Vyp 5, Sep/Oct 73, pp 953-957

**Abstract:** The influence of longitudinal and transverse acceleration over-loads on a previously elaborated system of two conditioned reflexes to an acoustic or a light stimulus was studied in 18 rats. Centripetal acceleration of 10 g, 210 rpm, was used. Errors, latent period and time of motor reaction were tested 1 minute after overload application. Most of these showed a tendency to increase after acceleration, with temporal parameters more pronounced, and longitudinal acceleration more effective than transverse. Habituation to the conditions employed was observed in the course of the experiments, and was more rapid for transverse accelerations. Some rats were more tolerant of the overload than others, though all were 6-month-old males of the same strain.

"Existence of  $\omega$ -Periodic Solutions of Differential Equations"

Alma-Ata, Vestnik Akademii Nauk Kazakhskoy SSR, No. 3(311),  
March 1971, pp 70-71

Translation: This paper considers the system of differential equations of the form:

$$\frac{dx}{dt} = f(t, x) \quad (1)$$

where the function  $f(t, x)$  is continuous over the combination of variables  $t \in (-\infty, +\infty)$ ,  $x = (x_1, \dots, x_n) \in E^n$  and is  $\omega$ -periodic over variable  $t$ .

It is assumed that the Cauchy problem

$$\begin{cases} \frac{dx}{dt} = f(t, x), \\ x(t_0) = x_0 \end{cases} \quad (2)$$

has a unique solution  $x(t) = p(t, t_0, x_0)$  in the interval  $t_0 \leq t < \infty$ .

1/6

USSR

NUREKENOV, T. K., et al, Vestnik, Akademii Nauk Kazakhskoy SSR, No 3(311),  
March 1971, pp 70-71

It is known [M. A. Krasnosel'skiy, "Operator for Displacement along Trajectories of Differential Equations", Moscow, 1966] that under these conditions there exists a shift operator  $U(\omega, \circ)$  along the trajectories of system (1), the immovable point of which determines the  $\omega$ -periodic solution; conversely, the initial datum of the  $\omega$ -periodic solution is the immovable point of the shift operator.

Hence, to prove the existence of an  $\omega$ -periodic solution of the system (1), it is sufficient to find the immovable point of the operator  $U(\omega, \circ)$ . To find that point, we use the conical method. The closed set  $K$  for the  $n$ -dimensional vector of space  $E_n$  is said to be a cone if:

- a) It follows from  $x, y \in K$  that  $\alpha x + \beta y \in K$ ,  $\alpha, \beta \geq 0$ ;
- b) It follows from  $x \in K$  that  $-x \notin K$ .

- 4 -

USSR

NUREKENOV, T. K., et al, Vestnik, Akademii Nauk Kazakhskoy SSR, No. 3(311),  
March 1971, pp 70-71

In this paper, we are considering the cone

$$K = \{x: x_i \geq 0; i = 1, \dots, n\}.$$

The fundamental difficulty here is finding the sufficient conditions in the terms of the right-hand member of (1) which guarantee the existence of an immovable point of the shift operator.

Lemma. Let  $U(t,0)$  be the shift operator of system (1). If the function  $f(t,x)$  does not decay with respect to the outer diagonal variable i.e.,

$$f_i(t, x_1, \dots, x_{i-1}, \bar{x}_i, x_{i+1}, \dots, x_n) \leq f_i(t, y_1, \dots, y_{i-1}, \bar{x}_i, y_{i+1}, \dots, y_n)$$

for  $x_j \leq y_j$ ,  $j \neq i$  then, from  $x \leq y$ , it follows that

$$U(t,0)x \leq U(t,0)y. \quad (3)$$

3/6

USSR

NUREKOV, T. K., et al, Vestnik, Akademii Nauk Kazakhskoy SSR, No. 3(311),  
March 1971, pp 70-71

Proof. If we take  $x_0 \leq y_0$ , while  $x(t)$ ,  $y(t)$  are solutions  
of (1) which satisfy the initial conditions  $x(t_0) = x_0$ ,  $y(t_0) = y_0$ ,  
and let  $y(t) - x(t) = h(t)$ , then

$$\frac{dh_i}{dt} = f_i(t, x(t)+h) - f_i(t, x(t)) = g_i(t, h),$$

where

$$g_i(t, h) = g_i(t, h_1, \dots, h_{i-1}, 0, h_{i+1}, \dots, h_n) \geq 0$$

for  $h_j \geq 0$ ,  $j = 1, \dots, i-1, i+1, \dots, n$ .

$h(t_0) = y_0 - x_0 \in K$ ; hence,  $h(t) \in K$ . [M. A. Krasnosel'skiy,  
"Operator for Displacement along Trajectories of Differential Equations",  
Moscow, 1966]. From this it follows that  $h(t) = y(t) - x(t) \geq 0$ ; i.e., the  
shift operator  $U(t, 0)$  is monotonic, which also had to be proved.

4/6

- 5 -

USSR

NUREKOV, T. K., et al, Vestnik, Akademii Nauk Kazakhskoy SSR, No 3(311),  
March 1971, pp 70-71

Theorem. (We obtained this result in May, 1970.) Let:

1) All conditions of the lemma be fulfilled, and let  
the shift operator  $U(\omega, 0)$  of system (1) be positive.

2) The function  $f(t, x) \leq Ax$  outside a sphere of radius  
 $R$ , where  $A$  is some constant matrix.

3) The shift operator  $V(\omega, 0)$  of the equation  
 $dx/dt = Ax$  be positive and have an eigenvector  $x_0$  in cone  $K$   
( $x_0$  is a point inside  $K$ ) with the eigenvalue  $\lambda_0$ ,  $0 < \lambda_0 \leq 1$ .

Then, system (1) has at least one nonnegative  $\omega$ -periodic  
solution.

Proof. Let us consider the ray  $tx_0$ , where  $t \geq 0$ . Because  
of the continuity, operator  $U(\omega, 0)$  invariantly remains a conic  
section  $0 \leq x \leq y_0$ , where  $y_0 = t_0 x_0$ , while  $\|y_0\| \geq R$ .

5/6

USSR

NUREKENOV, T. K., et al, Vestnik, Akademii Nauk Kazakhskoy SSR, No 3(311),  
March 1971, pp 70-71

Hence [M. A. Krasnosel'skiy, "Positive Solutions of Operator Equations",  
Moscow, 1962] shift operator  $U(\omega, 0)$  has an immovable point  $z_0$  in the section  
 $0 \leq x \leq y_0$ ; i.e.,

$$U(\omega, 0)z_0 = z_0.$$

Obviously,  $z_0$ , as the initial datum, determines the  
 $\omega$ -periodic solution.

The theorem is fully proved.

"Kinetics of Alkaline Hydrolysis of Some Selenophosphorusorganic Compounds"

Leningrad, Zhurnal Obshchey Khimii, Vol 43 (105), No 6, Jun 73, pp 1255-1257

Abstract: Reaction kinetics of the investigated compounds in aqueous alkaline solutions is of the first order both in regard to the substrate as well as the OH<sup>-</sup> ions. This appears to be analogous to alkaline hydrolysis of other phosphorusorganic compounds in which the reaction occurs via the S<sub>N</sub>2 mechanism at the phosphorus atom. Reactivity of selenophosphorusorganic compounds appears to be the same order reaction as that of the oxygen and sulfur analogues, if the selenium is in the P=Se group.

"Hydrogen Bonding with the Participation of P=Se and P=Te Groups"

Moscow, Doklady Akademii Nauk SSSR, Vol 211, No 6, Aug 73,  
pp 1363-1365

**Abstract:** The electron donating ability of the group P=X (X=Se, Te) was studied in the compounds of the type  $R_1R_2R_3P=X$  where  $R_1$ ,  $R_2$ ,  $R_3$  = Me, Et, Bu, Ph,  $EtO$ ,  $EtS$ ,  $PhO$ ,  $Me_2N$ ,  $Et_2N$ , and Cl (for X = Se), and Me,  $Me_2N$ ,  $Et_2N$  (for X = Te), by determining IR spectral changes due to the formation of hydrogen bonds with the phenolic OH group. It has been established that both the seleno- and tellurophosphoryl groups participate in hydrogen bonding as proton acceptors, the strength of the H-bond depending on the electronic effects of the substituents on the phosphorus atom. The electron donating ability of the P=X groups (X = O, S, Se, Te) is identical 1/2

"Study of the Electronic Effects of Trivalent Phosphorus Acids in Amides by the Method of NQR  $^{14}\text{N}$  and  $^{35}\text{Cl}$ "

Kiyev, Teoreticheskaya i Eksperimental'naya Khimiya, Vol 9, No 3, May-Jun 73,  
pp 404-408

Abstract: The nuclear quadrupole resonance [NQR]  $^{14}\text{N}$  and  $^{35}\text{Cl}$  spectra have been studied in a series of trivalent phosphorus acid amides. The results obtained were used in the study of the electronic structure of nitrogen atom in these compounds. Distribution of electronic density in the molecules of P<sup>III</sup> acid amides is determined by the inductive and mesomeric interaction. In addition to the P  $\pi$  - d  $\pi$  interactions between the N and P atoms, in case of the halogen substituents a substantial role is also played by the P  $\pi$  -  $\sigma$ -conjugation between the orbital of the unshared pair at nitrogen atom and the  $\sigma$ -orbital of the substituent.

"Investigation of Electronic Effects in Metal Organic Compounds by the Method of Nuclear Quadrupole Resonance. i Communication. Acid Chlorides of Trivalent Phosphorus Acids"

Moscow, Izvestiya Akademii Nauk SSSR, Seriya Khimicheskaya, No 7, Jul 72,  
pp 1513-1517

**Abstract:** Nuclear quadrupole resonance spectra  $^{35}\text{Cl}$  and  $^{14}\text{N}$  were taken on more than 30 acid chlorides (mono- and dichlorides) of trivalent phosphorus acid. Analysis of the spectra showed that mesomeric properties of the substituents at the phosphorus atom determine the shifts in the frequencies of nuclear quadrupole resonance  $^{35}\text{Cl}$  of trivalent phosphorus acid chlorides. On the basis of nuclear quadrupole resonance  $^{35}\text{Cl}$  and  $^{14}\text{N}$  data it has been shown that chlorine atoms in  $(\text{CH}_3)_2\text{NPCl}_2$  and nitrogen atoms in  $[(\text{CH}_3)_2\text{N}]_2\text{PCl}$  are not equivalent in the solid phase.

"Amidoesters of Selenophosphoric Acid"

Moscow, Izvestiya Akademii Nauk SSSR, Seriya Khimicheskaya, No 9, Sep 71,  
pp 2095-2097

**Abstract:** For purposes of studying the effect of the amide and ester group structure on the physical and biological properties of alkylselenophosphoric acid amides, the authors synthesized a series of new amidoesters of selenophosphoric acid by the addition of elemental selenium to corresponding trivalent phosphorus acid amides. The  $^{31}\text{P}$  and IR spectra of the resultant compounds were studied. It was found that the electron effects of the phosphorus substituents in amidoesters of selenophosphoric acid have little influence on the shielding of the phosphorus nucleus. A separate article will report the results of a study of insecticidal and fungicidal properties of the compounds.

"Synthesis and Properties of Diethylaryl Seleno- and Thiophosphates"

Moscow, Izvestiya Akademii Nauk SSSR, Seriya Khimicheskaya, No 6, Jun 71,  
pp 1266-1270

**Abstract:** The authors undertook to compare some properties of seleno- and thiophosphoric acid derivatives for the purpose of determining the effect of replacement of sulfur atom by selenium atom in the phosphyl group. For this purpose they synthesized a series of diethyl esters of arylthio- and selenophosphoric acids. The initial substances for the synthesis of these compounds were diethylaryl phosphites obtained by the interaction of phenol, 4-chlorophenol, 2,4-dichlorophenol and 2,4,5-trichlorophenol with diethylphosphorous acid diethylamide. The IR and NMR-P31 spectra of the resultant diethylaryl thio- and selenophosphates were studied. A study of the toxicity and insecticidal properties of these compounds showed that esters of selenophosphoric acid are more toxic for warm-blooded animals than their thio analogs and less toxic for insects. Replacement of the sulfur atom by the selenium atom in the phosphyl group.

"Diphenyl- and Phenyl-diethylamido-selenophosphoric Acid Esters"

Moscow, Izvestiya Akademii Nauk SSSR, Seriya Khimicheskaya, No 1, Jan 71,  
pp 131-136

Abstract: A series of alkyl esters of diphenyl- and phenyl-diethylamido-selenophosphoric acid was synthesized. Selenium was added to ethyl diphenyl phosphite and after the initial exothermic reaction subsided, the mixture was heated for 1 hr at 100°, filtered and distilled under vacuum yielding ethyl diphenyl selenophosphate (I), b.p. 133-134°/0.02 mm,  $d_4^{20}$  1.3709,  $n_D^{20}$  1.5705. (I) was also obtained from the reaction of diphenyl selenochlorophosphate with  $(C_2H_5)_3N$  and ethanol in benzene at 10-15°. The solid  $(C_2H_5)_3N \cdot HCl$  formed was removed by filtration and (I) distilled in vacuum; both methods gave the identical product. Following compounds were obtained by the second reaction: ethyl phenyl diethylamido-selenophosphate, b.p. 109-111°/0.001 mm,  $d_4^{20}$  1.2707,  $n_D^{20}$  1.5389; propyl diphenyl amido-selenophosphate, b.p. 141-143°/

"Thiol Esters of Selenophosphorus Acids"  
Moscow, Izvestiya Akademii Nauk SSSR, Seriya Khimicheskaya, No 3, Mar 70, pp 708-  
710

Abstract: Phenyl-diethylamido-seleno-chlorophosphate reacts with mercaptans and  
thiophenol in the presence of triethylamine to produce the corresponding thiol  
esters.

The ethyl- and butylthiol esters of phenyl-diethylamido-selenophosphoric acid are  
liquids, while the phenylthiol ester of this acid is a crystalline substance.  
Thiol esters of diphenylselenophosphoric acid are produced by a similar reaction.

The resultant products have a considerably higher boiling point than thiol esters  
of phenyl-diethylamido-selenophosphoric acid. The properties of eight esters of  
selenophosphorus acids are tabulated.

"Synthesis and NMR Spectra of Compounds Containing the :P(S)-N-P:  
Group"

Moscow, Izvestiya Akademii Nauk SSSR, Seriya Khimicheskaya, Vol 4,  
Apr 70, pp 914-916

Abstract: Mixed amides of dimethylthiophosphoric acid and trivalent phosphorus acids were obtained by reacting the methylamide of dimethylphosphoric acid with trivalent phosphoric acid chloride in the presence of triethylamine or by the reaction of N-dimethylthiophosphane-N-dichlorophosphine-N-methylamine with the dimethylamine in ether solution. Since the two phosphorus atoms are not equivalent -- PIV-N-PIII -- their respective signals were found to be split in doublets. Chemical shifts of the nuclei of tetracoordinated phosphorus are not affected by substituents on the tricoordinated P,

95120n Nuclear quadrupole resonance in some three-membered and other nitrogen-containing heterocycles. Osokin, D. Ya.; Safin, I. N.; Nuretdinov, I. A. (Kazan. Fiz.-Tekh. Inst.,

Kazan, USSR). *Dokl. Akad. Nauk SSSR*-1970, 190(2), 357-60 [Chem] (Russ). The spectra were measured for  $^{14}\text{N}$  and  $^{35}\text{Cl}$  in ethylenimine, 1-chloroethylenimine, 2,2-dimethylethylenimine, azetidine, piperidine, morpholine, pyrrolidine, and pyrrole with the use of a pulsed nuclear quadrupole resonance spectrometer for  $3\text{ cm}^3$  samples at  $77^\circ\text{K}$ . The results are tabulated together with the calcd. populations of the orbitals of the N-H and N-C bonds. The calcns. were carried out under the assumption that the principal tensor axis  $a$  of the elec. field gradient coincides with the orbital direction of the unfilled electron pair of the N atom. The bonds in ethylenimine and 1-chloroethylenimine may be described by the Coulson-Mossitt scheme (1949) at some delocalization of the electrons of the N-C bonds. The hybridization of the orbitals of the localized N-C bonds in azetidine is close to the tetrahedral one. V. Burjan

"Some Properties of Oxaphospholans"

Moscow, Izv. AN SSSR: Ser. Khimicheskaya, No 3, Mar 73, pp 648-650

Abstract: Some reactions of compounds with the oxaphospholan ring were studied. Di-(1-methyl-3-chloropropyl) ester of ethylphosphonous acid at 100-110°C was converted to two phosphorus-containing products which separate fairly readily on distillation.

Pure 2-oxo-2-phenyl-5-methyl-1,2-oxaphospholan (Ib) was synthesized by additional heating of the mixture of (Ib) and (IIb) at 200-220°C for 1.5-2 hours. Compound (Ib) reacts with PCl<sub>5</sub> in CHCl<sub>3</sub> with formation of the corresponding acid chloride. Reacting compounds (Ia) and (Ib) with P<sub>2</sub>S<sub>5</sub> in boiling benzene produces the thioxaphospholan compounds (IIIa) and (IIIb) which upon further heating with P<sub>2</sub>S<sub>5</sub> without a solvent at 120-130°C replace the oxygen in the oxaphospholan ring by a sulfur atom. The constants of the synthesized compounds are summarized in a table.

"Synthesis and Biological Activity of Some Thioglycidyl and Thieethanyl Esters of Pentavalent Phosphorus Acids"

Moscow, Izvestiya Akademii Nauk SSSR, Seriya Khimicheskaya, No 10, Oct 71,  
pp 2213-2217

**Abstract:** A series of thioglycidyl and thieethanyl esters of pentavalent phosphorus acid was synthesized and their biological properties were investigated. The thioglycidyl esters of dialkoxythio- and dialkoxydithiophosphoric acid exhibit no contact or systemic insecticidal activity, but they are active against pathogenic fungi. Toxicity of these compounds decreases considerably when  $C_2H_5O-$ -groups are replaced with  $CH_3O-$ , when the alkoxy radical is enlarged to  $C_4$ , and when the  $-P(=O)-S-C$  group is replaced by  $-P(=O)-C$  group. In contrast to the thioglycidyl, thioethanyl esters show distinct contact and systemic insecticidal properties coupled with higher toxicity towards the warm-blooded animals. The activity of 0,0-diethylthiophosphoric ester being much less pronounced than that of 0,0-diethylthiophosphoric ester. Substitution of  $-N(CH_3)_2$  for  $C_2H_5O-$  lowers the

1/2

USSR

No 10, Oct 71, pp 2213-2217

toxicity towards white mice, and the insecticidal and antifungal activity.  
When  $-N(CH_3)_2$  is substituted by  $-N(C_2H_5)_2$ , a further reduction in toxicity  
takes place, the insecticidal activity disappearing altogether.

"Reaction of  $\alpha$ - and  $\beta$ -Oxides with Phosphorus Acid Dichlorides"

Moscow, Izvestiya Akademii Nauk, SSSR, Seriya Khimicheskaya, No 10, Oct 71,  
pp 2225-2230

Abstract: Reactions of 3,3-dimethyloxethane (I) and 2-methyloxethane (II) and phenylphosphonic acid dichloride (III) and diethylamidophosphoric acid dichloride (IV) was carried out. (III) reacts vigorously with oxethanes forming with (I) the 0-2,2-dimethyl-3-chloropropylphenylphosphonic acid. The reaction of (II) with the above acid chlorides leads to the formation of isomeric products:  $C_6H_5P(Cl)OCH(CH_3)CH_2CH_2Cl$  and  $C_6H_5P(Cl)OCH_2CH_2CHClCH_3$ , the first compound forming predominantly. In contrast to (III), (IV) reacts with oxethanes only with heating or in the presence of a catalyst --- anhydrous  $ZnCl_2$ ; (IV) reacted with (I) gives diethylamido-2,2-dimethyl-3-chloropropyl-phosphoric acid dichloride and the reaction of (II) with (IV) produces a mixture of isomers:  $(C_2H_5)_2NP(Cl)OCH(CH_3)CH_2CH_2Cl$  and  $(C_2H_5)_2NP(Cl)OCH_2CH_2CHClCH_3$ .

In contrast to oxethanes, 3-chlorothiethane does not react with (III) without heating; at 150° it yields  $C_6H_5P(S)Cl_2$ . The direction of the opening of epoxy ring was studied on propylene oxide, leading to formation of isomeric mixtures. With  $PCl_3$  propylene oxide, leading to formation of isomeric mixtures. With  $PCl_3$ , propylene oxide gives primarily  $Cl_2POCH(CH_3)CH_2Cl$ , with (III) the same direction predominates, the product being  $C_6H_5P(Cl)OCH(CH_3)CH_2Cl$ , while with (IV) a 50:50 mixture of isomers is formed:  $(C_6H_5)_2NP(Cl)OCH(CH_3)CH_2Cl$  and  $(C_2H_5)_2NP(Cl)OCH_2CHClCH_3$ .

"The Effect of Salt Cation and the Solvent on the Isomerization of  
the Thiran Cycle Into the Thiethane Cycle in the Reaction of  
Thioepichlorohydrine With O,O-Diethyldithiophosphates of Alkali  
Metals"

Moscow, Izvestiya Akademii Nauk SSSR, Seriya Khimicheskaya, No 8,  
Aug 70, pp 1881-1882

Abstract: Reactions of thioepichlorohydrine with potassium, sodium,  
and ammonium O,O-diethyldithiophosphates were carried out in  
propanol, ethanol, and in water by heating the reagents for 2 hours  
at 60-70°C. It was found that the salt cation shows no effect on  
that reaction course. Depending on the solvent, however, the above  
reaction may yield either thioepoxyderivatives -- when ethanol or  
propanol are used -- or a mixture of isomeric compounds with the  
thioepoxy and thioethane structures, the latter forming predominantly  
when aqueous alcohol or water are used as solvents.

"Reactions of O,O-Diethyl S-(beta-Hydroxy-gamma-chloropropyl) Dithiophosphate  
and beta-Hydroxy-gamma-chloropropyl Thioacetate with Bases"  
Moscow, Izvestiya Akademii Nauk SSSR, Seriya Khimicheskaya, No 1, Jan 70,  
pp 145-147

Abstract: Reaction of the adduct of diethyldithiophosphoric acid and epichlorohydrin with  $\text{Et}_3\text{N}$  in toluene or with KOH in EtOH solution at its b.p. yielded O,O-diethyl S-2,3-thiopropyl thiophosphate (I) instead of the expected epoxy compounds. Diethyl chlorophosphite gave an adduct with thioglycidol and  $\text{Et}_3\text{N}$  in  $\text{Et}_2\text{O}$  at  $0^\circ$ . The adduct combined with  $\text{S}$  in boiling  $\text{C}_6\text{H}_6$  solution to form O,O-diethyl O-2,3-thiopropyl thiophosphate (II).  
B.p.,  $d^{20}$ , and  $n_d^{20}$  of II differ from respective constants of I. Formation of I according to proposed reaction scheme was confirmed by preparation of propylene sulfide from diethyldithiophosphoric acid and propylene oxide. Beta-hydroxy-gamma-chloropropyl thioacetate reacted with KOH in EtOH at b.p. to yield 44% 3-thietanyl acetate which gave 60% 3-thietanol, when hydrolysed with KOH in EtOH. B.p.,  $d^{20}$  and  $n_d^{20}$  of both products were determined.

Moscow, Izvestiya Akademii Nauk SSSR, Seriya Fizicheskaya, Vol. 36,  
No. 8, Aug 72, pp 1626-1631

Abstract: Experimental data obtained at the Kum-Bel' High-Altitude  
Station of the Physicotechnical Institute of the Academy of Sciences  
Uzbek SSR are reported. The station is 3200 m above sea level. The  
setup contains three series of wide-gap spark chambers with effective  
areas of  $2 \text{ m}^2$  placed above and below the target. The Cerenkov spectro-  
meter with total absorption and an ionization calorimeter with an area of  
 $10 \text{ m}^2$  were used to measure the primary energy  $E_0$ . Up to the present time  
experimental data obtained over 630 hours of operation of the device have  
been processed, with a high-voltage pulse being supplied to the electrodes of  
the spark chambers. Showers with an energy of  $> 200 \text{ GeV}$  generated in the target  
were selected for analysis. The following ratio was obtained for the number  
1/2

Vol. 36, No. 8, Aug 72, pp 1626-1631

of primary charged  $N_c$  and neutral  $N_n$  particles:  $N_c/N_n = 2.3 \pm 0.3$ ; this shows that the proportion of charged particles is ~34% of all nuclear active particles, thus making it possible to study pion-nuclear collisions by comparing the characteristics of the interaction of charged and neutral primary particles. A weak functional dependence between the inelasticity coefficient  $\langle K_{\pi^+} \rangle$  and the atomic number of the target nucleus and a strong functional dependence between this coefficient and the nature of the primary particles were obtained for interactions of hadron with  $E_0 > 200$  Gev.  $\langle n_s \rangle$  is almost a logarithmic function of  $E_0$ . The average multiplicity in the interaction of pions with neutrons in paraffin is identical within the experimental limit. A considerable azimuthal effect was observed for the angular distribution of secondary particles. The azimuthal effect has its greatest value for showers with  $n_s = 8-15$ , or a multiplicity close to average.

"The Effect of Pesticides Used in Agriculture on Vision"

Tashkent, Meditsinskiy Zhurnal Uzbekistana, No 6, 1972, pp 66-69

**Abstract:** People (683) working with pesticides (organic compounds containing chlorine and phosphorus) for 1-18 years were studied. Changes in the external part of the eye were observed in 11 percent of workers. These changes included allergic chronic conjunctivitis (33 cases), blepharitis (6 cases), and pterygium (20 cases). Atrophy of the optical nerve was found in 3 patients, retrobulbar neuritis in 2, and retinal angiopathy in 28 patients. Impairment of vision was mainly related to refraction anomalies and to losses in corneal transparency. Biomicroscopic study revealed some dilation of the perilimbal network vessels (9.8 cases), dystrophic changes of the iris (23.9 cases), and turbidity of the eye lens layers (15.1 cases). More changes in the eye structure were found among people working with pesticides up to 10 years, as compared with those who worked for longer periods. Some people experienced difficulty in adapting to darkness (42.3 cases). About 16.8 percent of people lost the ability to distinguish colors. Glaucoma developed in 4.9 percent of people studied.

"Device for Measurement of Thickness of Carbon-Free Steel"

Defektoskopiya, No. 3, 1970, pp. 80-85

Abstract: During production and heat treatment of steel products, a carbon-free layer is formed on their surface, which has considerably different physical properties from the main body of the steel. The primary difficulty in testing the thickness of this layer by electromagnetic methods is the presence of a large number of disturbing factors. The authors have developed a device to perform this task using a multi-parametric vortex current method to eliminate most of the disturbing factors. Using this method, extraction of information concerning the parameter of interest is reduced to separation of the voltage increment at each of several operating frequencies and multiplication of this increment by a certain constant-factor, different for each frequency. Results of plant testing of the device are presented.

"Use of a Transplantable Line of Cattle Embryo Kidney Cells for the Preparation  
of a Vaccine Against Foot-and-Mouth Disease"

Moscow, Veterinariya, No 5, May 73, pp 62-64

Abstract: Foot-and-mouth disease virus of strain A22 550 and of an epizootic  
A strain was cultured on a monolayer culture of transplantable cattle embryo  
kidney cells (CEKC). The virus that had been cultured on CEKC was inactivated  
with hydroxylamine, whereupon the virus suspension was freed of the  
excess hydroxylamine by dialysis. An experimental vaccine was prepared by  
combining 70% of the inactivated virus suspension with 25% of a 6% Al(OH)<sub>3</sub>  
suspension, 0.1% quinosol, and 5% glycerin. Saponin (0.05%) or vitamin B<sub>12</sub>  
was added as an adjuvant. The activity of the vaccine was estimated on the  
basis of the antigenic effect on rats, the index of resistance for mice 4-5  
days old, and the protective dose for adult mice. The effect of the number  
of passages on CEKC on the activity of the vaccine was determined. The  
antigenic activity of the vaccine derived from the epizootic strain was the

"Microwave and Ultrasound Therapy of Tapetoretinal Destruction"

Moscow, Vestnik Oftal'mologii, N5, 1973, pp 69-71

**Abstract:** A study was made of the therapeutic effect of microwaves separately and in conjunction with ultrasonics in the treatment of some forms of the degeneration of the retina. This is the first time microwave treatments have been used in the treatment of pigment degeneration. The test group was composed of 65 patients from 7 to 60 years old. Of these, 53 had pigmented retinas, 9 had a central degeneration of the Shtargart type, and 3 had a central degeneration of the Best type. Parameters for the microwave treatments were power - 20 volts, spacing - 9 cm, diameter of the emitter - 9 cm, length of the treatment - 10 to 15 minutes and 20 treatments daily. The ultrasonic treatments were conducted using an 800 kHz frequency, intensity - 0.3 volts/cm<sup>2</sup>, 1/2

"Investigation of the Agitation Leaching of a Fine Fraction of Slurry Sinter  
at the Pavlodar Aluminum Plant"

Tr. Kazakhsk. politekhn. in-ta (Works of the Kazakh Polytechnical Institute),  
1970, sb. 31, pp 254-255 (from RZh-Metallurgiya, No 12, Dec 70, Abstract No  
12 G212 by G. SVODTSEVA)

Translation: On the basis of experimental data on the agitation leaching of various fine fractions of slurry sinter over a wide range of duration, temperature, and caustic modulus, the following was established: 1) extraction of  $\text{Al}_2\text{O}_3$  and alkali > 90% from sinter fines is attained under the following leaching conditions: solution  $a_k = 22-26$  and  $\text{Al}_2\text{O}_3$  38-50 g/l; sinter size 1.8 mm; temperature 70-75°; liquid:solid = 2:3; and duration 15 minutes; 2) individual leaching of fine sinter fractions makes possible a reduction in the solid content of the discharge from the tubular apparatus and a 10- to 12-percent rise in the chemical yield of  $\text{Al}_2\text{O}_3$ . Agitation leaching of sinter fines decreases secondary loss of  $\text{Al}_2\text{O}_3$  and alkali.

"Reactance Properties of Germanium Diodes With Double Injection"

Tashkent, IAN Uzbekskoy SSR, Seriya Fiziko-Matematicheskikh Nauk, No 3, 1971, pp 40-42

**Abstract:** The paper presents the results of research on the reactance properties of diodes with double injection ( $P^+-N-N^+$  structures) made on the basis of relatively pure germanium single crystals of N-type with initial impurity concentration of  $5 \cdot 10^{12}/\text{cc}$ . The injection contacts on these specimens were made by alloying; the area of the PN junction was determined by the cross section of the crystal --  $0.4 \times 0.4 \text{ mm}^2$ ; the distance between opposite contacts was 0.4 mm. The reactance properties of the diodes were measured on a bridge circuit at a temperature of 77°K. The frequency of the small alternating signal varied from 1 to 45 MHz. The current-voltage characteristic as well as curves showing capacitance as a function of forward biasing current at various frequencies and curves for conductance as a function of current at various frequencies are given.

1/2

USSR

AZIMOV, S. A., et al., IAN UzSSR, Ser. Fiz.-Mat. Nauk, No 3, 1971, pp 40-42

The results show that inductive reactance in germanium diodes with rectifying contacts under the given conditions is due to change in the lifetime of the charge carriers. An increase in carrier lifetime causes injection over a considerable length of crystal and formation of an electron-hole plasma throughout the base region. The resultant plasma has constant inductance in the 10-30 ma-current region at frequencies from 10 to 30 MHz. Three figures, bibliography of seven titles.

PRIMARY SOURCE: Zhurnal Eksperimental'noy i Teoreticheskoy  
Fiziki, 1970, Vol 58, Nr 1, pp 3-13ANOMALOUS BROADENING OF SPECTRAL LINES  
IN NONLINEAR LIQUIDS AND ITS EFFECT ON STIMULATED  
SCATTERING PROCESSESBcl'shov, M. A; Venkin, G. V.; Zhilkin, S. A.; Nurminskiy, I. I.

Results of an experimental investigation of the spectral structure of laser radiation passing through a self-focussing liquid are reported. For complete isolation of the generator from the scattering medium the second harmonic of a neodymium laser is employed as radiation source. The generator can operate under incoherent mode or mode-locked conditions. The spectral structure of the radiation was investigated in the direction of the incident light as well as at an angle of 180°. Broadening of a quasicontinuous nature and broadening involving a set of discrete lines, the distance between which was, as a rule, not related to the incident radiation spectrum, are recorded. An analysis of the experimental results shows that the spectral line broadening may be ascribed to interaction between space and time modulation of the beam during its self-focussing.

REEL/FRAME  
19731061

21

AP0038021

Some data pertaining to stimulated combinational scattering under conditions of anomalous broadening of a laser pulse spectrum are reported. In particular the strong sensitivity of the scattering indicatrix to modulation of the initial radiation is noted.

"Properties of One Class of Functions"

Teoriya Optimal'n. Resheniy [Theory of Optimal Solutions -- Collection of Works], Kiev, 1972, pp 92-96 (Translated from Referativnyy Zhurnal Kibernetika, No 4, 1973, Abstract No 4V528, by S. Lebedev).

Translation: The continuous function  $f(x)$  has property (α) if for any  $x \in E_n$  there is a non-empty set  $M(x)$  of vectors  $g$  such that for all  $y \in E_n$

$$f(y) - f(x) \leq (g, y - x) + r(x, y),$$

where  $r(x, y) / \|x - y\|^{-1} \rightarrow 0$  as  $y \rightarrow x$  evenly in each closed and limited set  $K$ . Both concave functions and minimum-type functions which are neither concave nor differentiable have property (α): if  $f(x, z)$  is continuous with respect to  $x$  and  $z$ ,  $z \in Z$ , where  $Z$  is a compact topological space, and for each  $z \in Z$   $f(x, z)$  as a function of  $x$  has property (α), then  $f(x) = \min_{z \in Z} f(x, z)$

1/2

USSR

Nurminskiy, Ye. A., Teoriya Optimal'n. Resheniy, Kiev, 1972, pp 92-96.

also has property (α). Function  $f(x)$  is called quasidifferentiable if for each point  $x$  there is a non-empty set  $M(x)$  of vectors  $g$  such that

$$\frac{\partial f(x)}{\partial e} = \lim_{t \rightarrow +0} (f(x+te) - f(x)) t^{-1} = \min_{g \in N(x)} (g, e),$$

where  $e$  is an arbitrary unit vector.

Theorem. Function  $f(x)$  has property (α) and is quasidifferentiable, where  $M(x) = N(x)$ .

It is noted that for the functions, the minimum of the formula for the derivative of the direction was known earlier.

"State of the Venous and Lymph Network Under Conditions of Ionizing Radiation"

Moscow, Meditsinskaya Radiologiya, Vol 16, No 3, Mar 71, pp 50-53

Abstract: After a single exposure to gamma-radiation (400 r) 112 rabbits were subjected to resection of fragments of the major veins of the extremities and to removal of the popliteal lymph nodes. The venous and lymph beds of the extremities was studied for one year. Dynamics of the restoration of blood and lymph flows were studied by venography and lymphography. The venous bed in the operated extremities underwent restoration with formation of strong myogenic collaterals within 2-3 months. Under conditions of irradiation, this restoration process is considerably altered. During the first 2-3 days the network of fine vessels and the diameter of cutaneous vessels is considerably enlarged in the operated as well as in the control extremities. Subsequently, in the period of latent radiation sickness (up to the 8-10th day), the vascular channel in the unoperated extremity is almost normalized, whereas in the operated extremity, it remains the same as during the previous days. Also the vessels in both extremities are

1/2

USSR

pp 50-53

dilated, which indicates congestive phenomena. Restoration is considerably prolonged, up to the 110-120th day. In the case of the lymph system, the lymph outflow is restored within 6 months of the operation, whereas under the conditions of radiation sickness, the lymph outflow is not completely restored even after one year.

"Wire Substrate for Cylindrical Magnetic Films"

Elektron. tekhnika. Nauch.-tekhn. sb. Mikroelektronika (Electronic Technology. Scientific and Technical Collection. Microelectronics), 1971, vyp. 4(30), pp 164-175 (from RZh-Avtomatika, Telemekhanika i Vychislitel'naya Tekhnika, No 10, Oct 71, Abstract No 10B137 P)

Translation: Basic requirements are formulated which must be satisfied by a wire substrate, and the influence of the substrate on the properties of cylindrical magnetic films is analyzed. A detailed investigation is made of the physical and mechanical properties of thin BrB<sub>2</sub> copper-beryllium alloy wire, and recommendations are given on its use as a cylindrical substrate. A description is given of the technology for making a precision wire substrate, including processes of continuous tempering, mechanical treatment by rotating diamond draw plates, and thermal stabilization of properties. Seven illustrations, bibliography of nine titles. Resumé.

"The Problem of Superregenerative Amplification of Coherent Optical Radiation from Gas Lasers"

Tr. Un-ta druzhby narodov im. Patrisa Lumumby (Transactions of the Patrice Lumumba University of Peoples' Friendship) 62, 1972, pp 93-98 (from RZh--Fizika, No 7, 1973, Abstract No 7D967)

Translation: The kinetic equations describing a gas laser with heterogeneous broadening of the amplification lines in superregenerative strengthening of an external signal are numerically solved. It is shown that the use of modulating the laser Q by pulses with a duration of 3-4  $\mu$ s permits attaining a power amplification of the order of  $10^9$  for a weak signal. Evaluations are made for a He-Ne laser (1.15 microns, a 100-cm resonator, a mirror reflection coefficient of 0.98). The amplifier has a high transit time (of the order of microseconds) determined by the high Q of the resonator. Ye. Aleksandrov

"Amplification of Electromagnetic Radiation by Shock Excitation of Transient Phenomena in an Active Resonator"

Tr. Un-ta druzhby narodov im. Patrisa Lumumby (Transactions of the Patrice Lumumba University of Peoples' Friendship), 62, 1972, pp 84-88 (from RZh-Fizika, No 7, 1973, Abstract No 7D968)

Translation: A new type of laser amplifier, with shock excitation of the active resonator amplified by radiation, is proposed. The gain is evaluated and the shape of the amplifier output signal is calculated under the condition that at the frequencies of the spectrum of a signal different from the particular resonator frequencies, the amplification in one channel exceed unity with all losses taken into account. It is shown that through the use of the proposed amplifier there is no need for rigid stabilization of the signal frequency and the resonator length. It is suggested that this amplifier is especially effective for small amplification factors or active medium lengths. V. A. Khodovoy

"Material For Cathodes"

USSR Author's Certificate No 299887, filed 2 Oct 68, published 7 June 71  
(from RZh:Elektronika i yeye primeneniye, No 1, Jan 72, Abstract No 1A87P)

Translation: According to the invention, the cathode material differs from well-known materials in the fact that it consists of a solid solution of borides of rare earth and alkali-earth metals in which the borides in question are taken in the ratio: boride of rare-earth metal, from 60 to 95 molar percent; boride of alkali-earth metal, from 5 to 40 molar percent. The solid solutions of rare-earth and alkali-earth metals have smaller vapor pressures than separated borides and therefore evaporate more slowly than separated borides and consequently also their mixture. With a solution of a boride of an alkali-earth metal, e.g., BaB<sub>6</sub> in a boride of a rare-earth metal, e.g., LaB<sub>6</sub>, in the solid solution which is formed a metallic type of conduction remains, the emissive properties of which are better than in a boride of rare-earth metal. A reduction of the work function with LaB<sub>6</sub> because of the diffusion of BaB<sub>6</sub> into LaB<sub>6</sub> is accounted for by the fact that at the cathode surface a monatomic film is produced of the more active metal Ba, the work function of which is lower than with La. Tests of the emissive properties of the solid solutions showed that during operation of the cathode at 1400-1550° C the current

density of the emission for a composition containing 40 molar percent BaB<sub>6</sub> the residual LaB<sub>6</sub> is twice as high and for a composition with 50 molar percent BaB<sub>6</sub> the residual LaB<sub>6</sub> is 1.5 times as high as with the same conditions for pure LaB<sub>6</sub>. 105616v Electron spectra and structure of 1-indanone, tetralone, phthalide, and 1,3-indandione molecules. Belair, I. L.; Nurmukhametov, R. N. (Nauch.-Issled. Fiz.-Khim. Inst. im. Karpova, Moscow, USSR). *Zh. Fiz. Khim.* 1970, 44(1), 29-33 (Russ.). Electron absorption ( $20^\circ$ ) and luminescence ( $-196^\circ$ ) spectra of  $5 \times 10^{-6}$ - $5 \times 10^{-4}$  M solns. of 1-indanone (I), 1-tetralone (II), phthalide, and 1,3-indandione (III) are presented. The character of the resp. bands and the energy of  $\pi\pi^*$  and  $n\pi^*$  transmissions were detd. Energy of triplet  $\pi\pi^*$  level of I in cyclohexane, of II in *n*-alkanes, and of III, not appearing in optic transmissions are evaluated. The origin of long- and short-lived components of phosphorescence of I, and differences in phosphorescence lifetime of II in EtOH and *n*-alkanes was explained by relative positions of  $n\pi^*$  and  $\pi\pi^*$  levels changing when going from nonpolar to polar solvent. No fluorescence was found with the compds. studied except for 6-aminophthalide (strong lowering of  $S_1^*$  level, owing to  $\pi\pi^*$  transmission with transfer of charge, and higher position of  $n\pi^*$  level prevent nonradiation deactivation  $S_{1\pi^*}$ ). "Analysis Of The Critical Characteristics Of Gas Laser Superregenerator Amplification"

Radiotekhnika i elektronika, Vol XVII, No 7, July 1972, pp 1459-1444

Abstract: The paper considers a superregenerative regime of amplification of a coherent optical signal in a gas laser with modulated Q. As a continuation of a previous paper of which B.P. Kulakov is a cosauthor, an analysis is made of such basic characteristics as threshold sensitivity, maximum coefficient of amplification and dynamic range of a single-frequency gas laser superregenerative amplifier (LSA). The corresponding parameters are evaluated of a helium-neon LSA. At  $\lambda = 0.63$  micron these amount to  $10^{-8} L^{-1}$  watt,  $5 \cdot 10^2 V^2$  and  $5 \cdot 10^5 V^2$ , where L and V are the length and volume of the amplifier resonator taken in cm and  $cm^3$ . Curves are shown of the dependence of the coefficient of amplification of the LSA at  $\lambda = 0.63$  micron on the pulse duration of Q-modulation at various levels of the input signal. 1 fig. 12 ref. Translation: The authors investigate transient phenomena which may be used as the basis for laser operation in the superregenerative mode. It is assumed that Q-switching is done by a step function law; the transient phenomena are determined by the external signal. An amplification formula is derived as well as the amplitude characteristic of the amplifier in the self-excitation mode. The results of experiments with a helium-xenon laser are presented. Conditions are discussed for obtaining high amplifications, particularly pumping methods. Bibliography of fifteen titles. N. S.

"On the Problem of Evaluating the Output Power of a Continuous Laser"

V sb. Radiofiz. i rasprostr. elektromagnitn. voln (Radio Physics and Propagation of Electromagnetic Waves--collection of works), Moscow, 1970, pp 163-169 (from RZh-Radiotekhnika, No 11, Nov 70, Abstract No 11D335)

Translation: The proposed method of determining laser power takes account of nonuniformity in distribution of the field within the cavity, which makes it possible to apply the procedure to the case of highly active media as well as to the case of low coefficients of reflection of the mirrors in the cavity. It is shown that for certain forms of the saturation curve for the medium, an expression may be derived which relates the output power of a laser with uniformly broadened spectral line to the parameters of the medium and the cavity. One illustration, bibliography of three titles. W. S.

"Possibilities of Amplifying Optical Emission by Using a Continuous Gas Laser"

V sb. Radiofiz. i rasprostr. elektromagnitn. voln (Radio Physics and Propagation of Electromagnetic Waves--collection of works), Moscow, 1970, pp 152-162 (from RZh-Radiotekhnika, No 11, Nov 70, Abstract No 11D334)

Translation: The authors discuss an amplification process (superregenerative state) based on the fact that the Doppler effect produces frequency regions within the limits of the amplification curve for the active medium in a laser with corresponding states of the laser beyond the emission threshold; these regions do not coincide with the emission frequency. If the frequency of a monochromatic input signal lies in such a region, then avalanche amplification of the signal takes place, particularly when the signal frequency lies outside the frequency band of the cavity. An equation is derived for the transient amplitude response of the laser. It is shown that the output emission level depends on the input signal level on the rising segment of the amplitude response curve, a fact which may be utilized as the basis for an amplifier, where the rising segment is periodically repeated (pumping by

"Immunological Structure of Different Age Groups of the Population of Lugansk With Respect to Adenoviruses"

Moscow, Zhurnal Mikrobiologii, Epidemiologii, i Immunobiologii, Vol 48, No 6, Jun 71, pp 79-83

Abstract: The circulation of adenovirus types 1-7 among the adult and child population of the city of Lugansk was studied, and also seasonal fluctuations of adenovirus-induced infections, and the role of social, environmental, and meteorological factors in the spread of infection. Complement fixation and virus neutralization tests were used in the study of sera from 283 adults and 248 children, obtained monthly from September 1968 through August 1969. The virus neutralization reaction established the presence of antibodies to all of the seven types of adenoviruses, with the largest number of antibodies to adenovirus types 3, 7, and 1, and the smallest to types 2 and 4. The same ratio was true for the circulation of adenoviruses among the population. Larger numbers of antibodies to adenovirus type one were found in children than in adults, indicating a greater sensitivity of children to this type of

Vol 48, No 6, Jun 71, pp 79-83

adenovirus. The greatest morbidity of adenovirus infections, in many cases accompanied by respiratory complications, usually occurs during the late autumn and winter seasons. This can be explained by changes in living and social conditions, and particularly meteorological factors such as increased precipitation, sharp temperature fluctuations, gatherings of people in enclosed premises such as schools and other establishments, etc.
